

Step 1: Create a Simple Node.js Project

Install Node.js

```
# sudo yum install nodejs -y
```

Create a New Directory for Your Project

```
# mkdir nodejs-project
```

```
# cd nodejs-project
```

Initialize Node.js Project Run this command to create a `package.json` file:

```
# npm init -y ( This will create a basic package.json file. )
```

Create a Simple JavaScript File Create a file called `app.js`:

```
# touch app.js
```

```
# vi app.js
```

Add the following code in `app.js`:

```
function greet(name) {  
    console.log(`Hello, ${name}!`);  
}
```

```
greet('Coding4Deep');
```

Step 2: Install SonarQube Scanner for Node.js

Now let's integrate SonarQube analysis into this Node.js project.

1. Install SonarQube Scanner

- Download **SonarQube Scanner** for Node.js from the SonarQube website.
- Or `npm install -g sonarqube-scanner`
- Alternatively, if you have SonarQube already installed, you can use it directly

Step 3: Create `sonar-project.properties` File

In the root of your project, create a file named `sonar-project.properties`

```
# touch sonar-project.properties
# vi sonar-project.properties
```

Add the following content:

```
sonar.projectKey=nodejs-project
sonar.projectName=Node.js Project
sonar.projectVersion=1.0
sonar.sources=.
sonar.host.url=http://localhost:9000
sonar.login=your_sonar_token
```

- **sonar.sources=.** : This means all files in the current directory (i.e., your `app.js` file) will be analyzed.
- **Sonar.host.url** : Point to your **SonarQube server** (default is `http://localhost:9000`).
- **Sonar.login** : This is your **SonarQube token** for authentication (generated from **SonarQube UI** → **My Account** → **Security**).

Step 4: Run the SonarQube Analysis

```
# sonar-scanner
```
