

NEXUS INSTALLATION ON Centos/RHEL

Step 1: Update System

Log into your CentOS Vagrant VM and update the system:

```
sudo yum update -y
```

Step 2: Install Java

Nexus requires Java 8 or higher. Install OpenJDK:

```
sudo yum install -y java-17-openjdk
```

Verify Java installation:

```
java -version
```

Step 3: Create a Nexus User

For security reasons, create a separate user to run Nexus:

```
sudo useradd nexus
```

Set a password (optional):

```
sudo passwd nexus
```

Step 4: Download and Extract Nexus

```
cd /opt
sudo yum install -y wget
wget https://download.sonatype.com/nexus/3/nexus-3.77.1-01-unix.tar.gz
```

Extract the archive:

```
sudo tar -xvzf nexus-3.77.1-01-unix.tar.gz
```

Rename the extracted folder for convenience:

```
sudo mv nexus-3.* nexus
```

Change ownership:

```
sudo chown -R nexus:nexus /opt/nexus
sudo chown -R nexus:nexus /opt/sonatype-work
```

Step 5: Configure Nexus to Run as a Service

Switch to the Nexus user:

```
sudo su - nexus
```

Edit the Nexus configuration file:

```
vi /opt/nexus/bin/nexus.rc
```

Ensure the following line is present:

```
run_as_user="nexus"
```

Save and exit

Step 6: Create a Systemd Service

Exit the Nexus user session and create a systemd service file:

```
sudo vi /etc/systemd/system/nexus.service
```

[Unit]

Description=Nexus Repository Manager

After=network.target

[Service]

Type=forking

User=nexus

Group=nexus

ExecStart=/opt/nexus/bin/nexus start

ExecStop=/opt/nexus/bin/nexus stop

Restart=on-abort

LimitNOFILE=65536

[Install]

WantedBy=multi-user.target

Save and exit.

Reload systemd and enable Nexus:

```
sudo systemctl daemon-reload
```

```
sudo systemctl enable nexus
```

```
sudo systemctl start nexus
```

Check status:

```
sudo systemctl status nexus
```

Step 7: Access Nexus Web UI

Nexus runs on port **8081** by default. Access it via: `http://<IP>:8081`
